JSON data

Andrew Ba Tran

Contents

This is from the second chapter of learn.r-journalism.com.

JSON stands for JavaScript Object Notation and is the data structure behind many website features like maps.

Tracking down a website's JSON

Let's say theoretically you were interested in compiling a list of all Sinclair Broadcast TV stations and their locations.

You'd first visit their web site.

And then you might find they have a map!

Look at the developer tools in your browser and click over to **Network** you could sort by size and see there's a **json** file being called by the map.

If you click into the JSON link you'll see this data structure that includes affiliation, call letters, and latitude and longitude.

Here's a close up.

Importing JSON

It looks like it could be transformed into rectangular data frame so we can analyze it.

jsonlite package

We're going to use the **jsonlite**

First, install and load the package.

```
#install.packages("jsonlite")
library(jsonlite)
```

Then point to where the JSON file is. You can use the URL or the local path to it if you've downloaded it. I recommend downloading it as a backup in case the website is restructured.

Use the `fromJSON()` function.

```
json_url <-"http://sbgi.net/resources/assets/sbgi/MetaverseStationData.json"

## If the url above doesn't exist anymore uncomment the line below and run it
# json_url <- "data/MetaverseStationData.json"
```

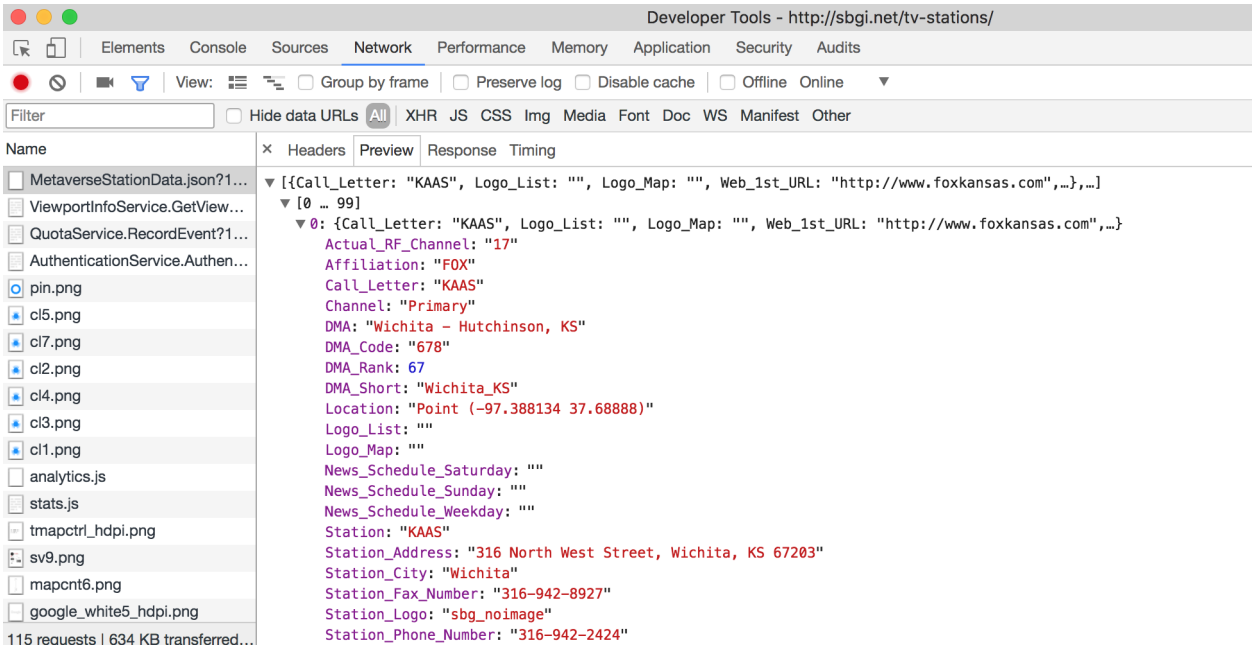

Figure 4:

```
[
    {
        "Call_Letter": "KAAS",
        "Logo_List": "",
        "Logo_Map": "",
        "Web_1st_URL": "http://www.foxkansas.com",
        "Web_Address": "http://www.foxkansas.com",
        "Station": "KAAS",
        "Channel": "Primary",
        "Affiliation": "FOX",
        "DMA": "Wichita - Hutchinson, KS",
        "DMA_Code": "678",
        "DMA_Short": "Wichita_KS",
        "DMA_Rank": 67,
        "Station_Status": "O&O",
        "Station_Address": "316 North West Street, Wichita, KS 67203",
        "Station_City": "Wichita",
        "Station_State": "KS",
        "Station_Zip": 67203,
        "Station_Logo": "sbg_noimage",
        "Station_URL": "http://www.foxkansas.com, http://www.foxkansas.com",
        "Station_Phone_Number": "316-942-2424",
        "Station_Fax_Number": "316-942-8927",
        "Actual_RF_Channel": "17",
        "News_Schedule_Weekday": "",
        "News_Schedule_Saturday": "",
        "News_Schedule_Sunday": "",
        "Location": "Point (-97.388134 37.68888)"
    },
```

Figure 5:

```
stations <- fromJSON(json_url)
```

Let's look at the structure of what we've imported.

```
str(stations)
```

```
## 'data.frame':    611 obs. of  26 variables:
##  $ Call_Letter           : chr  "KAAS" "KAAS-2" "KAAS-3" "KAAS-LD" ...
##  $ Logo_List             : chr  "" "/resources/assets/sbgi/Logo_List-DEFAULT.jpg" "/resources/assets/
##  $ Logo_Map              : chr  "" "/resources/assets/sbgi/Logo_Map-DEFAULT.jpg" "/resources/assets/s
##  $ Web_1st_URL           : chr  "http://www.foxkansas.com" "http://sbgi.net" "http://www.comettv.com/
##  $ Web_Address           : chr  "http://www.foxkansas.com" "http://sbgi.net" "http://www.comettv.com/

Figure 6:

```
##  $ News_Schedule_Saturday: chr  "" "" "" "" ...
##  $ News_Schedule_Sunday  : chr  "" "" "" "" ...
##  $ Location              : chr  "Point (-97.388134 37.68888)" "" "" "Point (-97.388134 37.68888)" ..
```

And how's it now look as a data frame?

```
View(stations)
```

Alright, this is a great start.

We can proceed to analyzing it and maybe visualizing it ourselves on a map.

But we'll get to that in later chapters.
